Experiment installation - Linux

No special installation is required.

There are two experimental problems and four Linux files:
- Exp1.Linux
- Exp2.Linux
- Exp1.Linux64
- Exp2.Linux64

They can be executed from ipho22 directory in a terminal by typing, e.g.

$ ./Exp1.Linux

Please use the test authorization code **8675309** when asked.

If Exp1.Linux and Exp2.Linux work fine for you, then 64bit versions can be safely deleted, either by hand in the ipho2022 folder, or with the command:

$ rm Exp1.Linux64 Exp2.Linux64

Possible issues

- A "Permission denied" message probably means you need to fix the file permissions by executing:

$ chmod a+x Exp*.Linux*

- In rare cases (IA32_EMULATION disabled in the kernel) Exp1.Linux and Exp2.Linux may refuse to work. In this case Exp1.Linux64 and Exp2.Linux64 should be used instead.

In case of problems, write a mail to it-support@ipho2022.com
